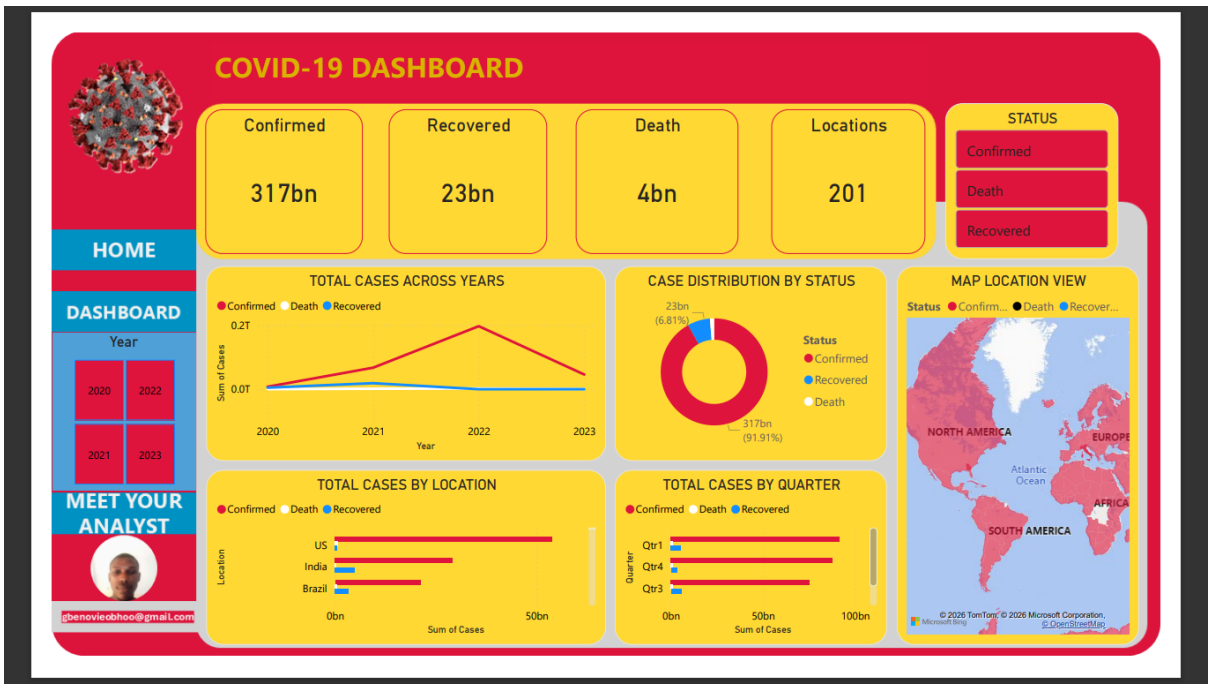
COVID-19 DATASET ANALYSIS REPORT

By Gbenovie Obhoo
Data Analyst



The Big Picture

We tracked COVID-19 across 201 locations worldwide, and here's what we found:

Overall Impact: We recorded 317 billion confirmed cases, with 23 billion people recovering and unfortunately 4 billion deaths. These are the headline numbers that frame our entire analysis.

What Happened Over Time

When we look at how cases evolved from 2020 to 2023, we see a clear story. Cases started relatively low in 2020 with 76 billion cases, then climbed sharply through 2021 and peaked around 2022 with 196 billion. By 2023, we saw a significant decline. This tells us the pandemic had distinct waves, and we're now in a much better position than we were at the height of the crisis. Inconsistencies were noted in the data as while the analysis confirms a drop in confirmed cases in 2023, the number of recovered cases did not add up to support that claim.

Where We Stand Today

Looking at the current status of all cases, the vast majority (91.91%, or 317 billion) are confirmed active cases. About 6.81% (23 billion) have recovered, and deaths account

for 1.28% (4 billion). While any loss of life is tragic, the recovery rate shows that most people who contracted the virus survived.

Geographic Hotspots

Three countries bore the brunt of this pandemic:

- **United States** had the highest number of cases by far with 53 billion confirmed cases
- **India** came in second with 29 billion confirmed but was also the country with the highest recovery in patients
- **Brazil** was third with 21 billion confirmed cases with the second highest recovery in patients

This concentration tells us that large, densely populated countries with high connectivity were hit hardest.

Timing Patterns

Breaking this down by quarter, we see that Quarter 1 consistently had the highest case numbers across the years, with Quarters 4 and 3 following. Quarter 2 had the lowest numbers. This seasonal pattern suggests the virus spread more readily during certain times of the year.

What This Means Going Forward

The data shows we've moved past the peak, but we need to remain vigilant in the heavily affected regions. We can adopt methods used in both India and Brazil to curtail the spread and speed recovery in affected patients. Overall, the recovery trend is positive, and understanding these patterns helps us prepare better for any future health emergencies.

Summary

The analysis was done through Power Bi, keeping us updated on the situation of the COVID-19 Pandemic.
